Blasthole diameter (D): Generally, the cost of drilling and blasting decreases as hole diameter increases. The relation between blasthole diameter and face height is approximately: $D = 0.001$ to $0.02 H$
Burden (B) : This is the distance in metres from a blasthole to the nearest free face and has the following approximate relation: $B = 25D$ to $40D$

may represent as much as 80 percent of the total drilling and blasting costs, mainly because of utilization of the lower cost explosive. By contrast, in the northeastern United States, hard rock formations exist in a relatively wet environment, where the explosives costs can be as much as 70 percent of the total drilling and blasting expense.

Chapter 8 BLAST DESIGN

Drilling and blasting is the controlled use of explosives and other methods such as gas pressure blasting pyrotechnics, to break rock for excavation. It is practiced most often in mining, quarrying and civil engineering such as dam, tunnel or road construction. The result of rock blasting is often known as a rock cut.. Drilling and blasting currently utilizes many different varieties of ...

Drilling and blasting - Wikipedia

Drilling and blasting can be considered as a system that consists of three different subsystems, including technical parameters like burden, spacing, depth, bit or drill hole diameter, penetration rate, explosive mass, etc. ;economic parameters such as bit cost, hourly drilling costs, drilling and blasting operational costs as well as environmental parameters, for example, emissions of NO_x, CO and SO_x.
