Chapter 5. AC Analysis. AC analysis calculates the linear (i.e. small signal) response of the circuit to stimuli or noise generating elements. As with port-based linear analysis, an initial DC analysis calculates the operating point of all nonlinear elements, which determines their linear equivalent for the AC analysis.

Chapter 5 asks the question, "What makes a perfect parent?" Every parent and "expert" has their own notions on the best way to parent a child, and these notions often contradict one another. Experts will always sit to the extreme of one side of a parenting issue, because experts who are not firm in this way rarely get any attention.
