### Cisco Ospf Command And Configuration

Each network area router configuration command is evaluated sequentially, so the order of these commands in the configuration is important. The Cisco software sequentially evaluates the address/wildcard-mask pair for each interface. See the network area command page in the Cisco IOS IP Routing: OSPF Command Reference for more information.

Cisco OSPF Command and Configuration Handbook provides example scenarios that demonstrate the proper use of every OSPF command that can be implemented on a minimum number of routers. This will enable you to learn each command without requiring an extensive and expensive lab configuration.

### Cisco OSPF Command and Configuration Handbook | Cisco Press

A number of different Cisco IOS OSPF configuration commands are available, but at its most basic, OSPF configuration uses three commands: the router ospf, network, and router-id commands. The router ospf process-id command is the beginning of any Cisco IOS OSPF configuration. It is used to create or modify an existing OSPF routing process and enters the user into OSPF router configuration mode.

For configuring OSPF and advertising networks use the same commands mentioned in exercise 1. Below output shows the adjacency states and the elected DR/BDR for the above topology. This output is taken from R1. As expected R4 is elected as DR because its Router ID is the highest among these routers.

Router(config)# router ospf process ID. This command will enable OSPF routing protocol in router. Process ID is a positive integer. We can use any number from 1 to 65,535. Process ID is locally significant. We can run multiple OSPF process on same router. Process ID is used to differentiate between them. Process ID need not to match on all routers.

Note: The area authentication command in the configuration enables authentication for all the interfaces of the router in a particular area. You can also use the ip ospf authentication command under the interface to configure plain text authentication for the interface. This command can be used if a different authentication method or no authentication method is configured under the area to which the interface belongs.

OSPF basic configuration is very simple. Just like with other routing protocols covered so far (RIP, EIGRP) first you need to enable OSPF on a router. This is done by using the router ospf PROCESS-ID global configuration command. Next, you need to define on which interfaces OSPF will run and what networks will be advertised.
