10 bits means you can get  $2^{10} = 1024$  different states of an analog signal, applied to a rotator with 360° rotation, provides the following resolution: Resolution (max) =  $360 / 1024 = 0.35^\circ$  That is, the ARS-USB connected to a motor and properly calibrated for 360° rotation, it can get the motor position each 0.35°.
