Most elementary particles (such as muons, pions, and intermediate vector bosons) are intrinsically unstable; they disintegrate spontaneously in a tiny fraction of a second—not long enough to do any serious chemistry. You can make short-lived “exotic atoms”, with (say) muons in orbit around the nucleus instead of electrons.

Particles can also be classified according to composition. Composite particles

Access Free Introduction To Elementary Particles 2nd Edition

refer to particles that have composition – that is particles which are made of other particles. For example, a carbon-14 atom is made of six protons, eight neutrons, and six electrons. By contrast, elementary particles (also called fundamental particles) refer to particles that are not made of other particles.
