Neyman made many other important contributions to mathematical and applied statistics. Notable examples include his work on sampling theory, in particular what is currently termed Neyman allocation in stratified sampling (Neyman 1938). (Neyman notes in the introduction to the paper that the problem was posed to him during his lectures in 1937 at the US Department of Agriculture, one of the proposes being Milton Friedman) Other contributions included the so-called 'smooth' goodness of fit ...
