The respiratory system aids in breathing, also called pulmonary ventilation. In pulmonary ventilation, air is inhaled through the nasal and oral cavities (the nose and mouth). It moves through the pharynx, larynx, and trachea into the lungs. Then air is exhaled, flowing back through the same pathway.

5 Functions of Respiratory System | Respiratory Anatomy

The primary respiratory system function is to take in oxygen and expel carbon dioxide. This occurs through the breathing process, when red blood cells collect the oxygen we have breathed in through the lungs and carry it throughout our bodies, while red blood cells also collect carbon dioxide and bring it back to our lungs where it can be exhaled.
